Typography

Section 508 of The Rehabilitation Act requires a high visual contrast between typography and backgrounds for on-screen applications.

To ensure text is Section 508 conformant compliant, it must meet a contrast ratio of 4.5:1 against its background color. All of the approved uses of our brand colors for black and white backgrounds are shown in the examples on this page.

The guidelines established by section 508 apply not only to web pages, but to all online copy that will be viewed primarily on a computer screen, including PDF files, Word documents, and PowerPoint presentations. It is not necessary for either logo artwork or printed materials to follow these guidelines.

Color

Use labels in data charts or figures to ensure that color is not the only way of conveying meaning.

Hyperlinks

Use text in hyperlinks that describe the content. Example:

- [Additional Accessibility and 508 guidelines](#) provides readers with specific content cues.
- [Read More](#) is generic, providing readers with no context about the link they are selecting.

Use a hyperlink text style that is different from the rest of the content styles to provide clearer visual cues for the reader. Style hyperlinks with two state changes, such as italic and bold, or bold and a color not used elsewhere in titles, subheads, bullets, or body copy styles. Examples:

- ***Additional Accessibility and 508 guidelines*** (Style changes: bold and italic)
- **Additional Accessibility and 508 guidelines** (Style changes: bold and underline)

Tables

To provide logical text order for screen readers, create tables with:

- Defined header and footer rows Individual table cells that have not been merged, split, or nested

- Live, editable text. Screen readers cannot access image-only tables

Imagery

Add alternative text labels for images or figures containing subject matter that is important for the user to understand. Alt text is not needed for accent visuals or background elements that do not include information critical to understanding the content.

Resources

Color Contrast Analyzer: This downloadable tool provides an eyedropper to check contrast ratios between foreground and background elements.

Color Blindness Simulator: This website allows users to upload jpg or png files and replicates different types of color blindness.
